CATCH BASIN

Installation, Operation, & Maintenance Guide

CB-500-S

CATCH BASIN

Installation, Operation, & Maintenance Guide

OVERVIEW

Striem Settler™ series model CB-500-S is a 500 gallon polyethylene catch basin intended for above- or below-grade installation. It is designed to separate heavy sand and sediment from the waste stream.

OPERATION

Solids laden wastewater enters through the inlet connection. In the settling chamber, heavy debris settles to the bottom before the wastewater exits through the outlet.

LIFETIME WARRANTY

Our products are designed to last the lifetime of the plumbing system in which they are installed. If they don't, we will repair or replace them at no charge. Product damage due to normal wear and tear may be repaired or replaced at a reasonable charge. See website for full details. **FAILURE TO INSTALL IN ACCORDANCE WITH THE INSTALLATION, OPERATION, AND MAINTENANCE GUIDE WILL VOID YOUR WARRANTY.**

USA**

WARNING

DO NOT AIR PRESSURE TEST UNIT!
DOING SO MAY RESULT IN PROPERTY DAMAGE,
SERIOUS BODILY INJURY, OR DEATH!
Refer to Installation Instructions for correct testing procedure.

LEAK/SEAL TESTING

Do not air test unit or Teleglide Riser system! Doing so may result in property damage, personal injury or death.

To perform a leak/seal test on the base unit, cap/plug all plumbing connections, remove the cover, and fill the unit with water just above the highest connection. Inspect unit and connections for leaks. Check water level at specific time intervals per local code.

WARNING: FAILURE TO INSTALL IN ACCORDANCE
WITH THE INSTALLATION, OPERATION, AND
MAINTENANCE GUIDE WILL VOID YOUR WARRANTY.

MAINTENANCE

- 1 Always take proper care to ensure a safe and healthy environment while maintaining the catch basin.
- 2 Remove covers.
- 3 Remove all contents from the main body of the CB-500-S, including wastewater, debris, and sediment. Contact a professional pumper contractor for best results.
- 4 Clean drain lines and diptube thoroughly of all debris.
- 5 Fill CB-500-S with water to invert of outlet.
- 6 Inspect cover gaskets for wear and tear and replace covers.
- 7 Dispose of contents per local code.

MAINTENANCE FREQUENCY

Maintenance frequency depends on the quantity, size, and contents of solids entering the catch basin. Striem recommends inspecting the unit every one to three months until a proper maintenance schedule can be established.

Debris and sludge must be cleaned out periodically to allow the free flow of wastewater through the unit.

TROUBLESHOOTING TIPS

Slower than usual drainage may indicate a blockage and a need to maintain the catch basin. Ensure the drain lines and diptube are cleared of all debris in the presence of slow drainage.

BELOW GRADE INSTALLATION INSTRUCTIONS

EXCAVATION

- 1 Surrounding soil must be undisturbed native soil or well compacted engineering fill.
- 2 Width and length of excavation shall be minimum 12" greater than the tank on all sides.
- 3 Depth of excavation shall be 6" deeper than tank bottom.
- 4 After the excavation is complete, create a well compacted support layer using approximately 3/4" clean, well-graded gravel, with no fines, so that the ground supporting the tank is a minimum 6" above native soil. (If using HDK with deadmen, minimum 12" above native soil).
- 5 Hold Down Kit is recommended for installations in high water table conditions to prevent float out. To be determined by specifying engineer. If necessary, order optional "High Water Table Hold Down Kit (HDK-13 or HDK-14 for use with concrete deadmen available)". See details below.

ABOVE GRADE INSTALLATION INSTRUCTIONS

UNIT INSTALLATION

- 1 Connect waste piping to unit.
- 2 Fill CB-500-S with water to outlet invert.
- 3 Ensure covers are properly installed.
- 4 Striem recommends our C24-M pedestrian cover for above-grade installations.

UNIT INSTALLATION

- 1 Lower and center the unit into hole using Striem lifting lug kit (included). Do not use chains or accessways to move the unit.
- 2 The water table height must not exceed the height of the tank body. The tank and risers are not intended to withstand groundwater levels above the height of the tank body. Exposure to high groundwater levels may compromise the structural integrity of the tank and risers.
- 3 Ensure the unit covers are level with finished grade.
- 4 Fill CB-500-S with water before backfilling to stabilize the unit and prevent float out during backfilling.
- 5 Maximum burial depth: 106" from standard cover height.

BACKFILLING & FINISHED CONCRETE SLAB

- 1 Preparation of sub grade per geotech recommendations.
- 2 Stabilize and compact sub grade to 95% proctor.
- 3 Before backfilling and pouring of slab, secure covers and risers (if used) to the unit.
- 4 Backfill using 3/4" clean gravel, with no fines (AASHTO M43 #57 Stone or similar). **Native soil, sand, and CLSM (aka, slurry or flowable fill) are not acceptable backfill materials.**
- 5 Thickness of concrete slab around the covers to be 8" for traffic loading. Thickness of concrete slab around the covers to be 4" for pedestrian or greenspace areas.
- 6 Concrete slab cannot interfere with the tank body below the risers.
- 7 Concrete to be 28 day compressive strength to 4000 PSI with 6 ± 1% air entrainment.
- 8 NO. 4 rebar (1/2") grade 60 steel per ASTM A615: connected with tie wire.
- 9 Rebar to be 2-1/2" from edge of concrete.
- 10 Rebar spacing 12" grid. 4" spacing around access openings.

PLATE HOLD DOWN KIT INSTALLATION

HDK-13 (If necessary)

- 1 Place HDK Anchor Strap over the tank in the HDK strap channel.
- 2 Connect the Turnbuckle to the Anchor Strap.
- 3 Connect the Turnbuckle to the Anchor Plate. Repeat steps 1-3 for all four corners.
- 4 Hold down force achieved by backfill weight acting on Anchor Plate.
- 5 Anchor Plate may be bolted to concrete slab, if required, by using holes provided in Anchor Plate.

DEADMAN HOLD KIT INSTALLATION

HDK-14 (If necessary)

- 1 Deadmen should be constructed according to the American Concrete Institute (ACI) code.
- 2 Deadmen should be 12" wide x 12" tall x 96" long.
- 3 Each deadman should have (2) anchor points for connection to (2) 3,500 lbs. rated turnbuckles.
- 4 The top of deadmen shall be installed flush with tank bottom. The side of deadmen shall be installed tangent to tank side.
- 5 Pre-fabricated straps rated to 3,333 lbs each should be connected to a turnbuckle on each side. Turnbuckles should be secured to the deadmen anchor points on each side of the tank such that the tank is held down.

TELEGLIDE RISER | INSTALLATION INSTRUCTIONS

CORRUGATED PIPE RISER KIT (CPRK) AVAILABLE AS ALTERNATE RISER SOLUTION. SEE CPRK INSTALLATION INSTRUCTIONS FOR MORE DETAILS.

- 1 Place CB-500-S so that the pipe connections line up with jobsite piping. Measure dimension X to determine riser height needed. Select the required risers from the adjacent table. Riser chart shows quantity for each tank manway.

Standard Cover Adapter	
Riser Height Needed	Risers Required Per Manway
0" - 5"	None
5" - 24"	SR24 (1)
24" - 39"	LR24 (1)
39" - 43"	SR24 (2)
43" - 58"	SR24 (1) + LR24
58" - 72"	LR24 (2)
72" - 90"	SR24 (1) + LR24 (2)
90" - 106"	LR24 (3)

- 2 Loosen upper clamp with nut driver bit (included with tank). If no risers are needed, adjust cover adapter height as needed. Ensure 2-1/2" minimum engagement is maintained. If risers are needed, remove covers from cover adapters, and cover adapters from the unit.

- 3 Insert cover adapters into the required risers until they stop. Tighten upper clamp to keep risers from shifting. Risers are installed from short to long. If using a standard cover adapter, measure the riser height needed, X + 5.25" down the sidewall of the risers. If using a cover adapter with monitoring equipment, measure the riser height needed, X + 7.75" down the sidewall of the risers. Mark the location with china marker (included with tank). Cover adapter may need to be adjusted outward for some dimension ranges. If mark is at the end of riser, no cutting is required.

- 4 Uninstall cover adapters and risers. Extend mark made in step 3 around the circumference of the riser. Cut along line with jigsaw, circular saw, or reciprocating saw. Make a mark around the circumference of the riser 3" from the cut end of riser. If no cuts were needed, make the mark 3" from the bottom of the bottom riser.

- 5 Wipe clean all riser and cover adapter sidewalls. Insert the first riser into the tank neck until the mark made in step 4 is in-line with the top of the neck gasket. This will ensure your risers reach the finished grade measured in step 1.

- 6 Install risers and cover adapters into the tank neck starting from the marked riser, moving up to finished grade. Upper clamps may need to be loosened or removed to aid in assembly.

- 7 Tighten all clamps. Striem recommends 57 in-lbs of torque. Reinstall covers on cover adapters. If tilting of the cover adapter is required to be flush with finished floor, it must be done after all clamps are tightened. A 6.5° tilt is the maximum.

- 8 If jobsite riser height conditions change after the previous steps have been completed, there is still room for vertical adjustment. As long as the minimum engagement of 2-1/2" on all joints are maintained, the adapters and risers may be adjusted/cut as many times as necessary.
